

Agenda

- Call, apply and bind
 - Polyfill for ↩
-

function

this

function.call(obj)

this

Call - invokes right there and then additional arguments are passed comma separated. Also, n number of arguments could be passed.

Apply → invokes right there and then additional arguments are passed inside an array. Also, only 2 args could be passed.

Bind → Doesn't invoke the fn immediately. Instead returns a function that could be called at a later point in time.

Additional args same as call.

A polyfill is a piece of code (usually JavaScript on the Web) used to provide modern functionality on older browsers that do not natively support it.
